+12V_LOGGER
U2
AMS1117-5.0
DNP
+5V_AMP
U_5V is only needed for analog path B (the AD620).
Leave unpopulated while running path A.

## 2. SAFETY CHAIN — hardware only, no MCU

Relay contacts use IEC numbering: 11 = COM, 12 = NC, 14 = NO.
Physical SRD-12VDC-SL-C pin mapping is set at footprint assignment (D-3).
+12V_PROT
+12V_MASTER
ESTOP_LOOP

K3
SRD-12VDC-SL-C
GND
ARM_LINE
PYRO_MATCH_P
PYRO_MATCH_N
K3 SHUNT + LOW SIDE: NC shorts the match
whenever DISARMED (D-008). NO ties the low
side to PYRO_RTN when armed. Break-before-
make REQUIRED — verify per D-3.
PYRO_FIRE_OUT
PYRO_CONT_LED
J_ARM
J_ARM: withdrawn by hand at the bench,
inserted LAST. Third series element (D-013).

## 3. PYRO INTERFACE — values blocked on O-1

BLOCKED: R_CONT, fuse and relay contact ratings all need the
e-match no-fire current (O-1). FIRING PATH is now complete; the
CONTINUITY CHECK IS NOT — it has no pre-arm source. See D-B.
PYRO_MATCH_CONT_LED_A
R_CONT
TBD
CONT_LED_A
PYRO_MATCH_P
PYRO_MATCH_N
U_CONT
PYRO_CONT_SENSE
GND
PYRO_MATCH_P
PYRO_MATCH_N
P1
2.54mm
P1 is a SHORT LOCAL run to the match (~1-2 m).
Firing current is sourced at the BENCH, so the pyro
pair never enters the umbilical — see note at O-18.
Continuity sense, opto-isolated. SENSE ONLY — the
IGNIS gate drive is NOT reused (D-045).
NOT FUNCTIONAL AS DRAWN: R_CONT + LED sit in
PARALLEL with the match and nothing sources them
before arming, so the lamp can never light. It fails
to the 'no match' reading, which is the safe direction.
Needs a pre-arm TEST source — decision D-B, review owner.
R_CONT must also survive the POST-FIRE case: once the
match opens while FIRE is held, the full rail sits across
R_CONT + LED to PYRO_RTN. Size it for continuous 12 V,
not only for the sense condition.

## 4. ANALOG FRONT END — values blocked on O-2

BLOCKED: PGA gain, excitation and reference choice need the
load cell datasheet. ADS1220 PGA is the primary front end (D-046).

A/B LINK NETWORK (D-054).
Path A, default: BYP1+BYP2 fitted, AD620 socket empty — ADS1220 PGA reads the bridge directly.
Path B: pull BYP1+BYP2, fit BYP3+BYP4 and the AD620 — two-stage chain, as Wirikuta had it.
Never fit all four: that shorts the amplifier output to the bridge.
AD620 minimum total supply is 4.6 V, so it CANNOT run on 3.3 V.
Path B therefore needs the +5V_AMP rail, and its output must be kept
inside the ADS1220 input range (0-7). Single-supply use also needs
AMP_REF biased above ground — value TBD with O-2.

## 5. LOGGER — ESP32-DevKitC V4, zero authority

No outputs reach any safety net. Radios stopped at boot (D-029).

MCU1 is drawn as the ESP32-WROOM-32D module so the GPIO names are readable.
The PHYSICAL part is a socketed ESP32-DevKitC V4 on 2 x PPTC191LFBN-RC (D-042),
so the symbol-to-socket pin mapping is set when the DevKitC footprint is made (O-16).
Pins avoid GPIO6-11 (SPI flash) and all strapping pins 0, 2, 5, 12, 15 (D-031).
RECORD sits on IO34 because 34-39 are INPUT-ONLY and cannot become a false RECORD.
RECORD pull-up is EXTERNAL: GPIO34 has none.
Open = not recording, so a broken line loses data,
never safety (D-032).

PATH 2 DEFERRED FOR REV A — open item O-19. Pins 8 and 9 are RESERVED and
carry explicit no-connect flags. They previously held THRUST_DIFF_P/N labels
that reached nothing on this board: a pair present at both connectors with no
source, which reads as a working analog backup and is not one.
Path 2 needs its OWN buffer — the ADS1220 swallows the signal into SPI.
Loss of path-2 redundancy for Rev A is recorded in REQUIREMENTS.md.
Shield: pin 12 bonds to bench ground HERE ONLY; the station end floats.
